APPENDICES

Section 1. Introduction

This Transportation Impact Analysis (TIA) has been prepared in support of the proposed McMinnville Mixed Use Development proposal, also identified as Gwendolyn Hotel. The project is located at the corner of 3rd Street and Ford Street in downtown McMinnville. This redevelopment replaces three existing buildings on the same city block.

The current policy of City of McMinnville requires that developments which generate more than 200 weekday trips or 20 PM peak hour trips on city streets provide a traffic impact analysis.

Project Description

The project will replace three existing buildings with a mixed-use development consisting of five floors: a ground floor restaurant, with hotel rooms and condominiums on the floors above. The project includes underground parking consisting of 68 parking spaces. The site will be redeveloped as a single building set to open in 2024.

Since the project is replacing previously existing buildings, it is assumed prior uses and the resulting trip generation have been permitted at some point over time.

Location Description

The proposed site is located at 619 NE 3rd Street in McMinnville, and comprises tax lots R4421BC 04201, R4421BC 04200, R4421BC 04300 and R4421BC 04500. Site parking will be accessed off of Ford Street between NE 3rd and 4th Streets. The main entrance to the building is on NE 3rd Street.

The subject site is located within the Downtown Design District (DD) and within the General Commercial (GC) zone district. The surrounding land uses consist of office buildings, restaurants, drinking establishments, small shops, and a theatre. The terrain is generally flat with a high level of connectivity throughout the existing street grid.

Existing Roadways

Roadways in the immediate vicinity of the site are generally downtown streets with speeds of 25 mph or less. On-street parking is prevalent around the site. There are no dedicated bicycle lanes in the downtown area of McMinnville. The sidewalk network is complete and accessible, with ADA ramps at corners along the street frontage.

The roadways comprising the study area intersections are described in Section 2. The study intersections are mapped in Figure 1.

Study intersection mobility targets adopted by ODOT and by the City of McMinnville are shown in Table 1 below. City of McMinnville operating standards were adopted as part of the City's Transportation System Plan (TSP), adopted in 2010. For the purposes of the McMinnville TSP, the mobility standard for all local (city) intersections and streets shall be a volume/capacity (V/C) ratio of 0.90.[1]

The 2010 TSP designates Highway 99W as an Expressway on a Regional or District Highway. As the current speed limit for Highway 99W in the study area is 30 mph, the ODOT intersections fall under the

[1] https://www.mcminnvilleoregon.gov/sites/default/files/fileattachments/planning/page/1305/c_chapter_2_guiding_goal_and_policies.pdf

"Non-MPO outside of STAs where nonfreeway speed limit <45 mph" mobility target[2] for this functional classification. For signalized intersections, the applicable mobility target for the Highway 99W intersections is a maximum V/C of 0.80.

More information can be found in the Existing Conditions section of this TIA. Vicinity and site maps are contained in Appendix A.

Table 1 Study Intersection Mobility Targets

Study Intersection		Traffic Control	Jurisdiction	Mobility Target (V/C)
1	Adams Street (OR 99W)/NE 2nd Street	Signalized	ODOT	0.80
2	Baker Street (OR 99W)/NE 2nd Street	Signalized	ODOT	0.80
3	Adams Street (OR 99W)/ E 5th Street	Signalized	ODOT	0.80
4	Baker Street (OR 99W)/NE 5th Street	Signalized	ODOT	0.80
5	NE Johnson Street/NE 3rd Street	Signalized	McMinnville	0.90

Scope of Analysis

Based on preliminary net new trip generation estimates (70 AM peak, 125 PM peak), the proposal will require a full TIA under City development code. Pursuant to email correspondence with Heather Richards, Planning Director at City of McMinnville, the study area is defined as the collector and highway classified streets and intersections in the immediate vicinity of the project. Intersections to be studied are shown below and mapped in Figure 1; all are signalized:

1. Highway 99W/Baker Street at NE 2nd Street
2. Highway 99W/Adams Street at NE 2nd Street
3. Highway 99W/ Baker Street at NE 5th Street
4. Highway 99W/ Adams Street at NE 5th Street
5. NE 3rd Street at Lafayette Street/Johnson Street

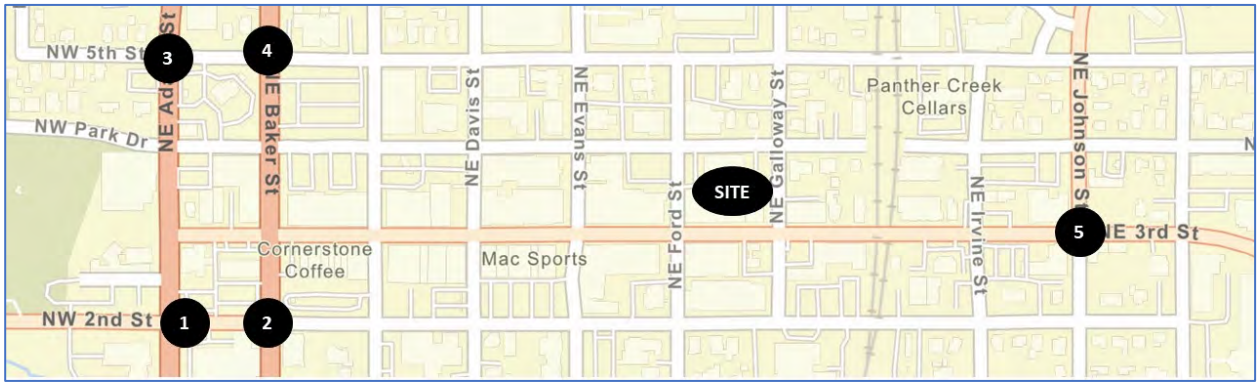

Figure 1 TIA Study Intersections

Map base from ODOT TransGIS

[2] Oregon Highway Plan Policies, https://www.oregon.gov/ODOT/Planning/Documents/OHP.pdf, Table 6.

The components of this TIA include:

- Existing transportation conditions, including vehicle classification counts, levels-of-service/mobility performance, safety based on crash history, and alternative/active transportation modes including transit, bicycles, and pedestrians.
- Pre-Development (without site) conditions for a 2024 opening year scenario, including background traffic growth and growth from in-process developments.
- Future Year 2024 conditions with the site, including:
  - Trip generation estimates for the proposed uses; accounting for trip generation from the previous uses
  - Trip distribution and traffic assignment for the site trips
  - Resultant levels-of-service with the site built out, with findings and conclusions and, if applicable, recommended mitigation

Analysis Methodology

All intersection capacity analyses described in this report were performed in accordance with the procedures stated in the Highway Capacity Manual, 6th Edition (HCM, Reference 4), using Synchro 11 software in accordance with analysis guidance provided in latest update of the ODOT Analysis Procedures Manual (APM)[3]. Both ODOT and the City of McMinnville use intersection volume-to-capacity ratios (V/C) as the operational performance measures ("mobility targets"). Overall intersection V/C is reported for the five study intersections, which are all signalized.

As traffic counts at or near all of the study intersections are at least four years old and were collected before the COVID-19 pandemic, counts were collected at all five intersections and seasonally adjusted (see Existing Conditions chapter, below). These counts were used to identify the AM and PM peak hours, the peak 15-minute flow rates, and peak hour factor (PHF) for each intersection. Queueing analyses presented in this report reflect 95th percentile queues as reported from the Synchro 11 software.

Data was collected using manual traffic count methods during weekdays on July 11-14, 2022. There were no civic, traffic, or weather-related events reported during this period.

Performance Measures and Operating Standards

Analysis Scenarios

This TIA reviews AM and PM peak hour conditions at the study area intersections for the following scenarios:

- 2022 Base Year/Existing Conditions
- 2024 Pre-Development without project (background growth and in-process trips)
- 2024 Post-Development with Site (all trips)

Examining prior TIAs conducted within the city, AM peak period is generally 7-9 AM while PM peak period is generally 4-6 PM. The traffic counts collected will be used to determine the peak 15 minute interval and AM and PM peak hours for each intersection.

Because the development proposal is consistent with existing zoning and is not proposing any comprehensive plan or zoning changes, or changes to the adopted Transportation System Plan, the evaluation scenarios do not include a 20-year post completion scenario.

[3] https://www.oregon.gov/odot/Planning/Documents/APMv2.pdf

Section 2. Existing Conditions

The existing conditions analysis identifies current traffic volumes and operations, traffic control and geometric characteristics, and recent collision history of the roadways near the study intersections.

Land Uses in the Site Area

The site is located in downtown McMinnville, within the Downtown Design District (DD) and within the General Commercial (GC) zone district. Uses are generally mixed single-story and small multi-story commercial, retail, and office uses.

Roadways at Study Area Intersections

- Adams Street and Baker Street are a one-way couplet and are included on the state highway system as Highway 99W (ODOT Highway #091). Both are two-lane, one-way facilities with posted speeds of 30 mph.
- NE 3rd Street is a City of McMinnville urban collector with a posted speed of 20 mph. It consists of one travel lane in each direction with on-street bike lanes east of NE Johnson Street.
- NE Johnson Street is a City of McMinnville urban collector with a posted speed of 25 mph. It consists of one travel lane in each direction with on-street bike lanes north of NE 3rd Street.
- NE 2nd Street is a City of McMinnville urban minor arterial with a posted speed of 25 mph. It consists of one travel lane in each direction with shared traffic and bicycle lanes (“sharrows”).
- NE 5th Street is a City of McMinnville urban collector with an unposted speed, assumed for this TIA to be 20 mph. It consists of one travel lane in each direction with shared traffic and bicycle lanes (“sharrows”).

Table 2 summarizes the roadway characteristics of the study area roadways.

Table 2 Study Area Roadway Characteristics

Roadway	Jurisdiction	Functional Classification	Posted Speed (mph)	Direction of Travel	Travel Lanes	Bike Lanes	On-Street Parking[4]	Sidewalks
Adams Street (99W SB)	ODOT	Expressway on Regional or District Highway	30	One-way SB	2	No	Yes	Yes
Baker Street (99W SB)	ODOT	Expressway on Regional or District Highway	30	One-way NB	2	No	Yes	Yes
NE 2nd Street	McMinnville	Minor Arterial	25	Two-way E-W	2[5]	Sharrows	No	Yes
NE 3rd Street	McMinnville	Collector	20	Two-way E-W	2	East of Johnson St.	West of Lafayette St./ Johnson St.	Yes
Lafayette Street/Johnson Street	McMinnville	Collector	25	Two-Way N-S	1	North of 3rd St.	No	Yes
5th Street	McMinnville	Collector	25[6]	Two-way E-W	1	Sharrows	Yes	Yes

[4] Only parking within 100 feet of the intersection.
[5] NE 2nd Street also has left-turn lanes in each direction between Adams and Baker Streets.
[6] There was no speed limit signage posted in the vicinity; it is assumed for this TIA to be 25 mph.

Multi-modal Transportation

The transportation network surrounding the site consists of downtown streets with on-street parking and a complete sidewalk network. The streets in the vicinity are generally low speed at 20-25 mph where vehicles and bicycles are expected to share the roadway. There are no dedicated bicycle lanes.

The sidewalk network is complete. In general, sidewalks are 5-8 feet wide. The majority of corners are constructed with dual curb ramps, reflecting recent ADA guidelines.

Yamhill County Transit is the public transportation provider serving McMinnville. Yamhill County Transit Routes 1, 2, 3, and 4 all provide weekday service within a few blocks (within walking distance) of the proposed site. All of the routes connect through the McMinnville Transit Center, located on NE 2nd Street between Galloway and Irvine, approximately 1,000 feet from the site. A map of Yamhill County Transit's McMinnville System and route schedules are found in Appendix B.

Existing Traffic Volumes

A check of traffic impact studies submitted to the City over the past 3-4 years did not yield any recent counts that would be usable for this analysis. Thus, new traffic counts were collected July 11-14, 2022, at the five study intersections, for two-hour AM and two-hour PM peak periods in five-minute intervals.

The nearest Automated Traffic Recording (ATR) stations are several miles from the site:

- ATR #36-006, MP 41, Highway 18 SW of McMinnville approximate five miles southwest of McMinnville
- ATR #36-005, MP 47.45, Highway 99W approximately eight miles south of McMinnville

Neither ATR station yielded traffic volume information that could be used for the five study intersections.

Raw traffic volumes were seasonally adjusted, consistent with ODOT's *Analysis Procedures Manual*[7], Chapter 5 "Developing Existing Year Volumes" to arrive at peak hours volumes approximating the 30th highest hour of the year. Three methods were evaluated for applicability for this report:

- On-Site ATR Method: counts adjusted based on date/time of year and nearby ATR station(s). In this case, there are no ATR stations in proximity to the site or study intersections.
- ATR Characteristic Table Method: adjustment of counts based on ATRs located within Oregon in similar traffic environments with average daily traffic (ADT) within 10% of the sites being studied. There are no ATRs that match the circumstances being studied in McMinnville.
- Seasonal Trend Method: adjusts counts based on factors developed for the time of year of the count and a seasonal factor based on traffic characteristics of the area. This was the most relevant and applicable of the three methods evaluation and was chosen for this study.

Two ODOT seasonal factor tables were referenced. The first was to consider ATRs in the vicinity of McMinnville and identify traffic and road characteristics for the study area. Table 3 shows the ATR characteristics for ATR stations within 10-15 miles of McMinnville. These indicate that the study area is a mix of rural and small urban fringe area types, commuter and summer traffic trends, with ADTs in the range of 7,500 to 34,000 vehicles per day. Highway 99W in the study area (Baker and Adams Streets) averages approximately 22,000 to 23,000 ADT (ODOT TransGIS database), which puts the highway in the middle of that range. Thus, the seasonal traffic adjustments will be an average of commuter and summer traffic trends.

[7] https://www.oregon.gov/odot/Planning/Documents/APMv2_Ch5.pdf

Using ODOT's Seasonal Trend Table (July 2021 update;
Table 4), and the averaging of summer and commuter trends from that table, yields a Count Date Seasonal Factor to Peak Period Seasonal Factor of 1.013. In other words, the raw traffic counts collected in July 2022 will be adjusted upward by 1.3% to approximate the 30th highest hour peak volumes.

The adjusted existing Year 2022 AM and PM peak hour volumes are shown in Figure 2.

Traffic counts included vehicle classifications (large trucks and buses), bicycles, and pedestrians.

Detailed counts are included in Appendix C.

COVID-19 Impacts
Recent traffic impact studies conducted in Yamhill and Marion Counties have collected Year 2021 and 2022 counts and have compared them to pre-pandemic conditions. These counts collected in the past year are indicating for the most part that traffic volumes have reached or now exceed pre-pandemic conditions. No further adjustments to the July 2022 traffic counts are recommended to account for COVID-19 impacts.

Table 3 ATR Characteristic Table for Study Area

2021 Seasonal Traffic Trend	Area Type	# Lanes	Weekly Traffic Trend	2021 AADT	OHP Classification	ATR Number	County	Highway Route, Name & Location	MP	State Highway Number	K_{30}
COM	Rural	4	Weekday	34400	Statewide Highway	36-004	Yamhill	OR99W/OR219, Pacific Highway West, 0.01 mile west of Brutscher Street	21.81	91	0.0933

Adjustment Factors for Counts	
Count Date Seasonal Factor (Average)	0.8942
Peak Period Seasonal Factor (Average)	0.8827
Count Date Seasonal Factor / Peak Period Seasonal Factor	1.013
Counts will be adjusted upward by:	1.30%

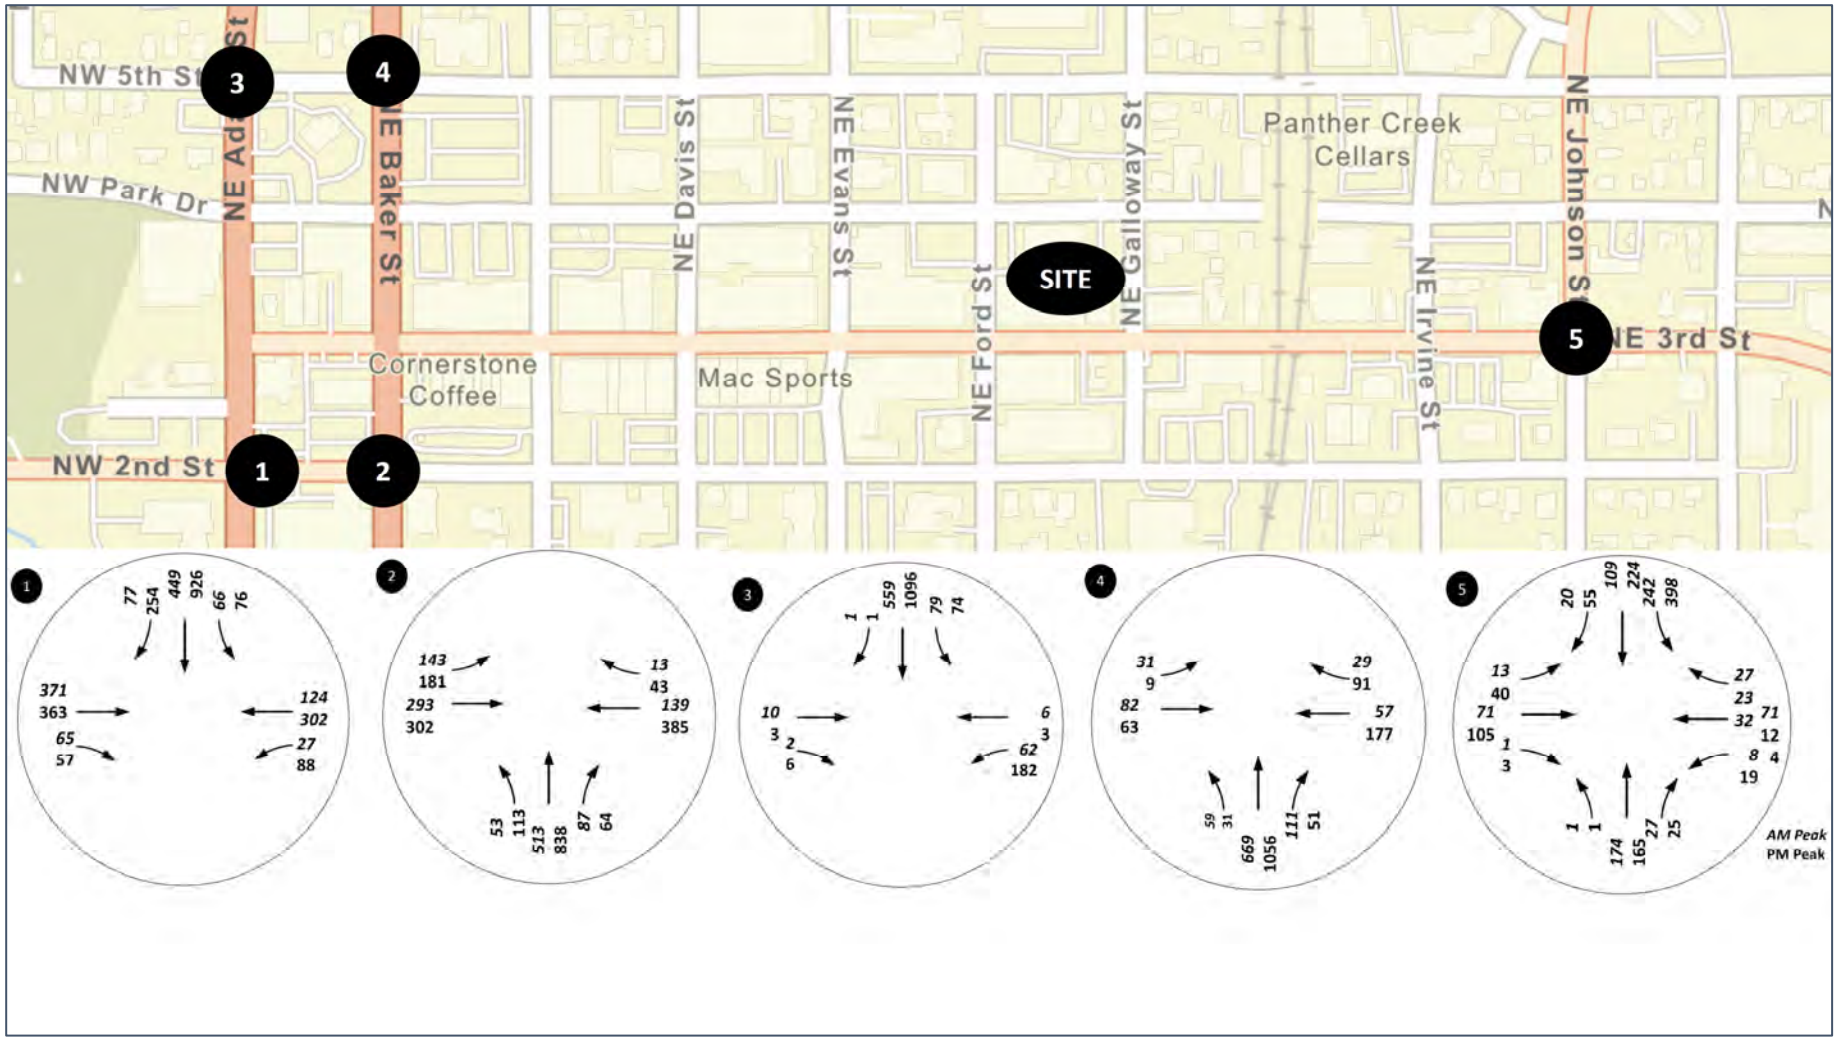

Figure 2 TIA Study Intersections Existing Peak Hour Volumes

Traffic Operations

The seasonally adjusted existing (2022) volumes were entered into Synchro 11 traffic models, as were trucks, bicycles, and pedestrians. The counts were used to develop peak hour factors (PHF) for each approach. Existing signal timing and operations were input to the Synchro model. The traffic counts were used to identify the peak 15-minutes and peak hour for each of the AM and PM peak periods.

Existing vehicular levels-of-service are shown for each of the five intersections in Table 5.

All intersections are operating within mobility/V/C targets for ODOT and McMinnville.

Table 5 Existing Peak Hour Intersection Operational Analysis

Intersection	Mobility Target/ Jurisdiction	Peak Hour	Analysis Results – LOS/ V/C[8]
			2022 Existing Conditions
1. Adams Street at NE 2nd Street	0.80 ODOT	AM Peak	C / 0.57
		PM Peak	C / 0.71
2. Baker Street at NE 2nd Street	0.80 ODOT	AM Peak	B / 0.49
		PM Peak	C / 0.69
3. Adams Street at NE 5th Street	0.80 ODOT	AM Peak	B / 0.29
		PM Peak	B / 0.60
4. Baker Street at NE 5th Street	0.80 ODOT	AM Peak	C / 0.42
		PM Peak	C / 0.59
5. Johnson Street/Lafayette Street at NE 3rd Street	0.90 McMinnville	AM Peak	B / 0.50
		PM Peak	D / 0.84

Crash Analysis

Reported crash history for the most recent five complete years of data for each study intersection was reviewed in an effort to identify potential safety issues. Collision data was retrieved from ODOT's Traffic Data System – Crash Reports[9] for the period January 1, 2016, through December 31, 2020. Complete Year 2021 collision data was not available at the time this document was produced.

Table 6 shows the intersection crash history for each of the study intersections, while Table 7 is the intersection crash rate assessment. To calculate the observed crash rate, the average number of crashes per year for each intersection was divided by the average annual million entering vehicles to arrive at a "crashes per million entering vehicles" rate. Each intersection's rate was compared to ODOT's 90th percentile "expected" rate by intersection configuration and land type. In the case of all intersections, the 4SG (four-leg signalized intersection) and urban land type rate of 0.86 was used.[10]

A critical crash rate analysis was also conducted using ODOT's Crash Rate Calculator.

[8] HCM 2000 Results for full intersection.
[9] https://tvc.odot.state.or.us/tvc/
[10] Analysis Procedures Manual, Chapter 4 Safety, Exhibit 4-1 "Intersection Crash Rates per MEV by Land Type and Traffic Control."

All intersections are within ODOT's statewide 90th percentile crash rates with one exception: the intersection of Baker Street (Highway 99W) and NE 2nd Street. That crash rate is elevated due to a high number of collisions up to and including 2017. In the fall of 2017, the City of McMinnville completed a signal replacement and improvement project at that intersection. The crash history from 2018 through 2020 at that intersection shows the annual number of collisions, and crash rate, have substantially decreased. It is anticipated that when Year 2021 collision data is available, the crash rate at this intersection will be within the ODOT statewide 90th percentile threshold.

The ODOT Safety Priority Index System (SPIS) reports from the latest reporting period (2020 database, 2017-2019 crash reporting period) were reviewed to determine if any of the study intersections are being monitored for elevated or potentially elevated crash rates and preventative measures. The SPIS is a systemic scoring method that identifies potential safety problems on state highways based on three years of crash data. The SPIS score considers crash frequency, crash rate, and crash severity. ODOT screens SPIS segments annually to identify and prioritize which have potential for safety improvements and merit further investigation.

The SPIS analysis found the following:

- Adams Street: 2017-2019 SPIS Score 29.89, 70th percentile range
- Baker Street: 2017-2019 SPIS Score 32.85, 75th percentile range
- Johnson Street at 3rd Street vicinity: 2017-2019 SPIS score 34.05, 75th percentile range
- 5th Street at 99W vicinity: SPIS Score 22.64, 45th percentile range

None of these sites are within ODOT Region 2's Top 15% SPIS sites by score.

Appendix D contains the ODOT crash report data and crash rate calculator summary.

Table 6 Intersection Crash History (2016-2020)

Intersection	Collision Type					Severity			Total Crashes
	Angle	Turning	Rear-End	Bike/Ped	Other	PDO[11]	Injury	Fatal	
1. Adams Street at NE 2nd Street	7	9	4	1	0	12	9	0	21
2. Baker Street at NE 2nd Street	11	11	6	2	2	19	13	0	32
3. Adams Street at NE 5th Street	1	0	3	0	1	3	2	0	5
4. Baker Street at NE 5th Street	4	3	2	1	1	7	4	0	11
5. Johnson Street/Lafayette Street at NE 3rd Street	1	5	2	0	1	5	4	0	9

Table 7 Intersection Crash Rate Assessment

Intersection	Total Crashes	90th Percentile Intersection Crash Rate	Observed Crash Rate at Intersection	Observed Crash Rate > 90th Percentile Rate?	Critical Crash Rate[12]	Observed Crash Rate > Critical Cras Rate?

[11] PDO = Property Damage Only

[12] Using ODOT's 2020 Crash Rates by Jurisdiction and Functional Classification

[13] Signal and intersection modification project completed by McMinnville in fall 2017. Since then, average annual collisions have been reduced from 8.0 per year before the improvement to 5.3 per year after. Future summaries should indicate that this intersection's crash rate will fall below the 90th percentile rate.

Section 3. Pre-Development Conditions

Pre-development traffic conditions are future-year estimates without the proposed site. The Gwendolyn Hotel proposal is anticipated to be completed and occupied before the end of 2023. However, to be conservative, a Year 2024 “year of opening” scenario is assumed and analyzed here.

Pre-development Year 2024 conditions consider the following:

- Planned transportation improvements contained in an adopted plan or program potentially impacting/increasing capacity or improving traffic operations at any of the five study intersections between now and 2024; and
- Existing traffic volumes plus two years of traffic growth without the site proposal.

Planned Transportation Improvements

There are no upcoming transportation improvements currently on the City’s Capital/Transportation Improvement Program in the next five years that would directly impact any of the study intersections.

Background Traffic Growth

Background traffic growth consists of general growth in traffic that occurs over time, and traffic from developments that have received approval by the City but have not yet been completed and occupied.

In review of the City’s Transportation System Plan and recent TIAs conducted in the area, an average 1.3% per year background growth rate is used to calculate future traffic volumes.

For in-process development traffic, the City indicates that the development projects listed below have been approved but are not yet occupied. All of these approvals are smaller and do not have an associated TIA.

- Boutique Retreat: 9th Street and Alpine Avenue – 9 room lodging (New Build)
- Pebble Dentistry: 9th Street and Lafayette Street – Dental Office (New Build)
- Granary Row: 10th Street and Lafayette Street – New Restaurant (New Build)
- Okta Restaurant/Tributary Hotel: 618 NE 3rd Street (Rehab of Vacant Building)
- Two Dogs Taphouse: 4th Street and Evans Street – New Restaurant (Rehab of Vacant Building)
- Wine Tasting Room: 3rd Street and Baker Street – New Drinking Place (Rehab of Vacant Building).

To account for in-process traffic growth, in the absence of TIAs, the background traffic growth rate is increased to 1.5% per year.

Pre-Development Traffic Operations

The existing, seasonally-adjusted traffic volumes were increased by 1.5% per year for two years to reflect the 2024 conditions before completion and opening of the site. Figure 3 shows the Year 2024 Background traffic volumes, while Table 8 shows the resultant levels-of-service and V/C ratios for the study intersections.

Figure 3 Year 2024 Background Traffic Volumes

All intersections are operating within mobility/V/C targets for ODOT and McMinnville.

Table 8 Existing and 2024 Background Peak Hour Intersection Operational Analysis

Intersection	V/C Mobility Target/ Jurisdiction	Peak Hour	2022 Existing Conditions (LOS/v/c)	2024 Background Conditions (LOS/v/c)
1. Adams Street at NE 2nd Street	0.80 ODOT	AM Peak	C / 0.57	C / 0.59
		PM Peak	C / 0.71	C / 0.73
2. Baker Street at NE 2nd Street	0.80 ODOT	AM Peak	B / 0.49	B / 0.51
		PM Peak	C / 0.69	C / 0.71
3. Adams Street at NE 5th Street	0.80 ODOT	AM Peak	B / 0.29	B / 0.30
		PM Peak	B / 0.60	B / 0.62
4. Baker Street at NE 5th Street	0.80 ODOT	AM Peak	C / 0.42	C / 0.43
		PM Peak	C / 0.59	B / 0.65
5. Johnson Street/Lafayette Street at NE 3rd Street	0.90 McMinnville	AM Peak	B / 0.50	B / 0.52
		PM Peak	D / 0.84	C / 0.84*

**Fully actuated signal; cycle length and splits optimized in Synchro model*

Section 4. Transportation Impact Analysis

Site Information

Generally, the Downtown Design Standards and zoning map allow for commercial uses with "Main Street" qualities. In the surrounding area, this includes small shops, services, restaurants, drinking establishments, a historic hotel, and a theatre.

The Gwendolyn Hotel project includes the following specific uses:

- Hotel with 85 guestrooms
- Ground floor retail (specialty retail small shops) of 2,700 SF
- Ground floor restaurant of 6,200 SF
- Roof-top restaurant/drinking place of 2,145 SF
- Roof-top salon of 1,500 SF

The hotel includes typical amenities such including a lobby, meeting rooms, and back-of-house administrative offices and storage. The restaurant would be a ground floor establishment with sidewalk seating. A parking garage is included with 68 stalls under the building. The rooftop uses include a terrace with a fitness room, a rooftop bar/restaurant, and a pool and hot tub. Most uses are for hotel guests, although the rooftop bar/restaurant may be open to the public during afternoon and evening business hours (i.e., closed in the morning). The retail space is expected to be a small shop. The project also includes underground parking, development of required underground utilities, landscaping, and associated frontage on-street improvements.

Existing buildings being replaced include small offices (formerly a bookkeeping company, realtor office, and co-working space), with a total of 5,891 SF; the News-Register publishing offices, with a total of

6,093 SF; and mixed commercial uses including, over time, a restaurant, hair salon, property management office, and a community church utilizing a total of 6,048 SF.

Trip Generation

Trip generation estimates were developed using the 11th Edition of the Institute of Transportation Engineers' *Trip Generation Manual* (September 2021), using the closest land use descriptions applied in the "general urban/suburban" setting. Trips were estimated for both the proposed uses and uses that are being replaced, resulting in "net new trips" for the analysis. The ground floor retail is intended to consist of small, specialty shops. There is no specific ITE Code for that use in the 11th Edition, so the 9th Edition Land Use Code 826 (Specialty Retail) is used in this trip generation analysis.

Because of the mixed-use nature of the development, an internal capture rate of 10% of site trips was assumed using the ITE *Trip Generation Handbook*, 3rd Edition (September 2017). Internal trips consist of those trips that start and end within the same development such as hotel guests visiting the salon; the restaurant or roof-top pub/drinking place; or customers of the restaurant, pub, or salon walking from adjacent buildings to visit those establishments, in which case the trips are not vehicular but walking or bicycling.

Table 9 summarizes AM peak, PM peak, and weekday trip generation based on the site proposal and uses that were in the existing buildings. AM and PM trips were separated into "ins" and "outs" for assignment to the street network. The result of the trip generation analysis is that the new site is expected to generate 70 net new AM peak hour vehicle trips, 125 net new PM peak hour vehicle trips, and 1,566 net new weekday vehicle trips.

Table 9 Site Trip Generation Calculations

Land Use	Size	ITE Code[14]	Trips		
			AM Peak	PM Peak	Weekday
Previous (Existing) Uses					
Small Office	5,891 SF	712	10 (8 in, 2 out)	13 (4 in, 9 out)	85
Newspaper/ Single tenant office	6,093 SF	715	11 (10 in, 1 out)	18 (2 in, 16 out)	80
Mixed/ Commercial	6,048 SF	712	10 (8 in, 2 out)	13 (4 in, 9 out)	86
TOTAL			31 (26 in, 5 out)	44 (10 in, 34 out)	251
Proposed Uses					
Retail (Specialty Retail store)	2,700 SF	826 (ITE 9th Edition)	3 (2 in, 1 out)	7 (3 in, 4 out)	120
High-turnover (Sit-Down) Restaurant	6,200 SF (Ground level)	932	59 (32 in, 27 out)	56 (34 in, 22 out)	665
Drinking Place (Restaurant/Bar)	2,145 SF (roof level)	975	0 (closed in the AM)	24 (16 in,8 out)	240
Hotel	85 rooms	310	39 (22 in, 17 out)	50 (25 in, 25 out)	679
Salon	1,500 SF	918	2 (1 in, 1 out)	2 (1 in, 1 out)	20
Subtotal			103 (57 in, 46 out)	139	2,019

[14] Institute of Transportation Engineers *Trip Generation Manual*, 11th Edition (September 2021), unless otherwise indicated in the table.

Land Use	Size	ITE Code[14]	Trips		
			AM Peak	PM Peak	Weekday
Mixed Use Internal Trip Capture (10%)			*(10) (6 in, 4 out)*	*(14) (8 in, 6 out)*	*(202)*
NET NEW TRIPS			**70**	**125**	**1,566**
Inbound			**25**	**61**	
Outbound			**45**	**64**	

Trip Distribution and Traffic Assignment

The net new trips from the trip generation analysis shown above were distributed (assigned) to the transportation network based on existing traffic patterns, general trip distribution from the 2010 TSP and forecast market data for the proposed development. The primary trip destinations for the distribution analysis are:

A. Downtown McMinnville and Linfield College area: 5% of trips[15]
B. Southwest via Oregon Highway 18: 25% of trips
C. West McMinnville: 3% of trips (via 2nd Street)
D. Northeast of McMinnville via Highway 99W: 32%
E. East and Northeast of McMinnville via Oregon Highway 18: 35% (via 3rd Street).

Figure 4 summarizes the trip distribution on a map of the area. Table 10 summarizes the trip distribution by direction and time of day for the traffic assignment.

Figure 5 shows the traffic assignment of site trips to the study intersections, while Figure 6 shows Year 2024 total trips including background and site traffic for the traffic operations analysis.

Table 10 Trip Distribution by Time of Day

Destination	%	AM Trips			PM Trips		
		In	Out	Total	In	Out	Total
A. Downtown McMinnville and Linfield College area	5%	1	2	3	3	3	6
B. Southwest via Oregon Highway 18: 25% of trips	25%	6	11	17	15	16	31
C. West McMinnville (via 2nd Street)	3%	1	1	2	2	2	4
D. Northeast of McMinnville via Highway 99W	32%	8	14	22	20	20	40
E. East and Northeast of McMinnville via Oregon Highway 18 (via 3rd Street).	35%	9	16	25	21	22	43
TOTAL	**100%**	**25**	**45**	**70**	**61**	**64**	**125**

[15] These trips will likely use the City's downtown street system to circulate and will not be routed through any of the TIA's study intersections.

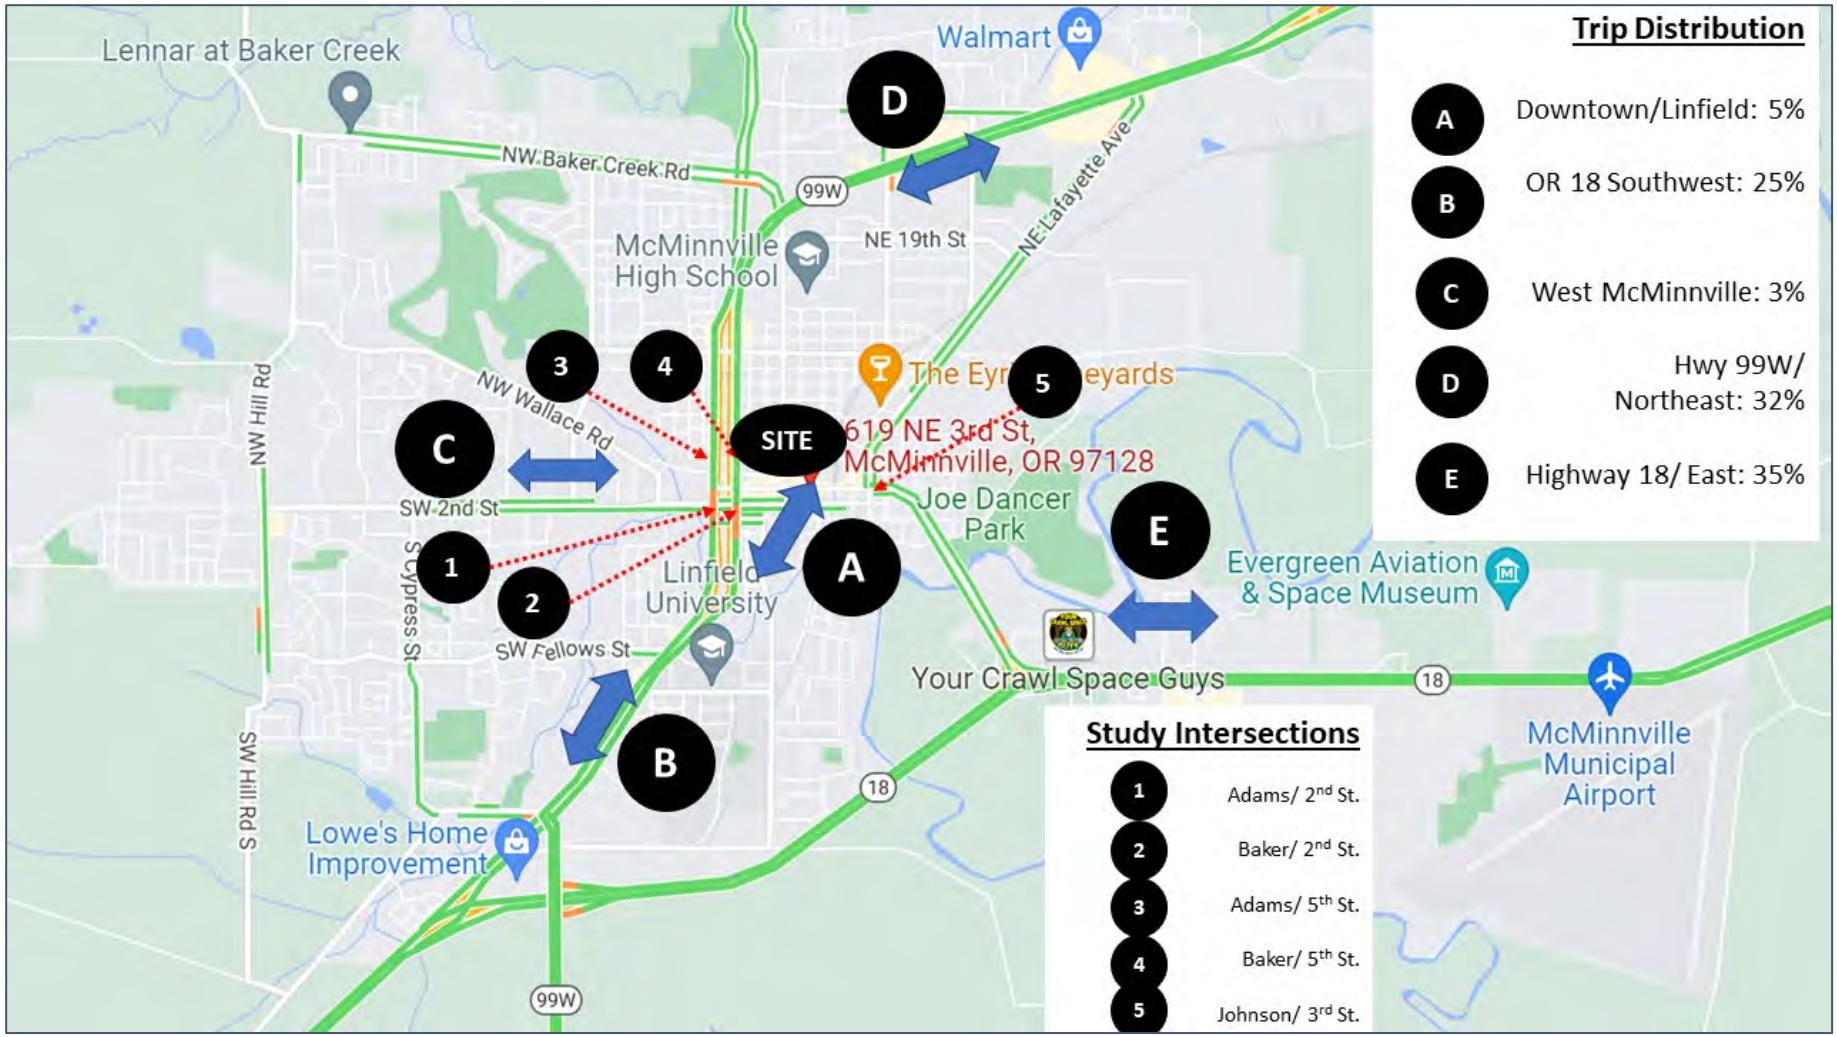

Figure 4 Trip Distribution

Figure 5 Assignment of Site Trips

Figure 6 Year 2024 Total Peak Hour Volumes (with site)

Comparative Observations

The Gwendolyn Hotel proposal is a mixed-use hotel with on-site commercial uses. To be conservative, the trip generation and distribution analysis assumes a more suburban-style setting where trips are predominantly by automobile.

To gain an understanding of how trips may actually occur to and from the site, observations were made at similar land uses in downtown McMinnville. The observation sites included the Hotel Oregon, a McMenamin's establishment which has guest rooms, a rooftop bar, and a ground floor pub.

The observations conclude that guests of a mixed-use building similar to Hotel Gwendolyn may not be making as many vehicle trips as the more traditional ITE analysis above would indicate. People tend to drive into and park in downtown McMinnville, then use the complete sidewalk network to walk to various establishments for the day or evening. On-site amenities proposed for Gwendolyn Hotel are also expected to contain trips on-site. Hotel guests tend to park for their stay and walk around downtown, with some vehicular travel to tourist and recreational destinations, including Spirit Mountain Casino and the surrounding vineyards.

Many trips will be made by walking or bicycling around downtown. There are some shuttle tours that are available to accommodate multiple guests, instead of each person or family driving independently. The completeness of the sidewalk system downtown helps to encourage walking or slow bicycling, while the low traffic speeds can accommodate on-street bicycling around the area.

Site Access/ Sight Distance Evaluation

The proposed parking garage access on Ford Street is adjacent to the current parking lot access for the existing buildings. The photos in Figure 7 show the current access point and sight distances both approaching the driveway as well as looking down the street from the driveway. Sight distance triangles for vehicles exiting the parking garage will be established on the site plans and will comply with City of McMinnville requirements.

Note: while there are on-street parked vehicles near the driveway access, the low traffic levels and slow speeds of Ford Street will allow the access to operate satisfactorily.

Figure 7 Gwendolyn/Ford Street Access Photos

Existing Ford Street Access Location

Looking South from Existing Ford Street Access

Ford Street Looking Toward Existing Site Access

Section 5. Operational Analysis

The Year 2024 total traffic conditions analysis forecasts the operation of the study intersections for 2024, with background traffic and the inclusion of traffic generated by the site proposal. The analysis addresses both the AM and PM peak hours.

The operational analysis consists of two parts:

- Intersection operation analysis, resulting in levels-of-service (LOS) and V/C ratios for the five study intersections; and
- Queuing analysis, showing the 95th Percentile queue lengths by approach for each of the study intersections.

Mobility targets for ODOT and the City of McMinnville were applied to the results. Table 11 shows the peak hour operational analysis for all three scenarios (2022 Existing, 2024 Background, and 2024 All Trips). All intersections are operating within the mobility targets for ODOT and McMinnville in the Year 2024 All Trips scenario for both AM and PM peak hours.

Intersection Queuing Analysis

An intersection queuing analysis was conducted for key study area intersections for the AM and PM peak hours for the Year 2024 with site (All Trips) scenario. The 95th percentile queues were summarized from the Synchro 11 timing reports. In the case of Highway 99W (Adams and Baker Streets), there are no separate turn lanes; thus, the queuing is assessed for the potential to back-up into adjacent intersections.

Table 12 shows the 95th percentile queues from the HCM 2000 intersection reports (HCM provides intersection V/C ratios). The results in **bold** indicate the queue length exceeds storage capacity.

During the Year 2024 All Trips scenario for the AM peak, no apparent queuing issues are projected. However, during the Year 2024 PM peak scenario, two of the intersections are projected to have queues that either exceed turn lane storage lengths or may extend into adjacent intersections. These are:

- NE 2nd Street at Baker Street/Highway 99W: eastbound and westbound traffic will queue due to through movements. These issues were observed to occur periodically during the July 2022 traffic counts, and the site is anticipated to have minimal impacts to this situation. Because this and the adjacent NE 2nd Street at Adams Street intersections are built-out and are working off of a coordinated, fixed-time signal operation; other than minor changes to the signal timing patterns by ODOT, there are no other recommended mitigation improvements at this location.
- NE Johnson Street/Lafayette Street at NE 3rd Street: queues for westbound through traffic and southbound left turns are projected to exceed storage lengths. These issues were observed at times during the July 2022 traffic counts. As this intersection is fully actuated, the City should continue to monitor this intersection for changes in cycle length and phasing operations. The site is anticipated to have minimal impacts on queuing at this intersection.

Table 11 Year 2024 Total Traffic Conditions Peak Hour Intersection Operational Analysis

Intersection	Mobility Target/ Jurisdiction	Peak Hour	2022 Existing Conditions	2024 Background Conditions	Year 2024 Total Traffic Conditions (With Site)
1. Adams Street at NE 2nd Street	0.80 ODOT	AM Peak	C/ 0.57	C/ 0.59	C/ 0.59
		PM Peak	C/ 0.71	C/ 0.73	C/ 0.74

	Eastbound Thru/ Right	300+	75	100
	Westbound Left	100	<25	25
	Westbound Thru	300+	125	***350***
	Westbound Right	40	<40	>40[17]
	Northbound (all)	230	100	150
	Southbound Left	150	100	***300***
	Southbound Thru/ Right	300+	50	150

[16] 95th Percentile Queue Length from Synchro 11 timing report, rounded to nearest 25 feet.
[17] Westbound through traffic queues impact ability of right-turning vehicles to enter the right-turn storage lane.

Section 6. Findings and Recommendations

The proposed development of the Gwendolyn Hotel can comply with the City of McMinnville's transportation-related standards, including mobility (V/C) and crash rates. The site is expected to generate a modest level of new vehicle trips in the downtown area, with minor impacts to the five study intersections. All five intersections can accommodate the additional trips and remain within the mobility targets of the agencies. The fully actuated signal at Johnson Street/Lafayette Street and NE 3rd Street should be monitored by the City over time for signal timing adjustments to accommodate traffic growth.

Four of the study intersections exhibit collision rates within the statewide 90th percentile rate expected for the intersection. One intersection, Baker Street/99W at NE 2nd Street, exhibits an elevated collision rate that is slightly over the 90th percentile rate. However, this appears to be due to a high number of collisions in the early part of the five-year reporting period that occurred prior to a signal and intersection improvement completed by the City of McMinnville in late 2017. Since that time, the collision rate has noticeably decreased, and it is expected that adding the full Year 2021 collision data to the five-year analysis will show a reduced collision rate.

The site has public transportation service and a transit center within walking distance. The sidewalk network is complete within the site's vicinity. The front (walk) entrance to the site is readily accessible and will be designed to comply with requirements of the Americans with Disabilities Act (ADA).

While the downtown street network does not have on-street bike lanes, the slow speeds allow bikes to share the road environment with vehicles with no apparent issues. Bike lanes are included on the roadways approaching all five study intersections.

No traffic mitigation measures are recommended.

OR 99W AT 2nd ST SIGNAL REPLACEMENT Sealed bids for the OR 99W AT 2nd ST SIGNAL REPLACEMENT, Project No. 2015-17 will be received by Roy Markee, Project Manager, at the Community Development Department, 231 Northeast Fifth Street, McMinnville, Oregon 97128, until the bid closing time of 2:00 p.m., on the 13th day of April 2017, at which time the bids will be publicly opened and read. Bidder shall submit the required first-tier subcontractors disclosure form within two working hours of the bid closing time. Bidders whose bids and/or disclosure statements are received after the stated times will be considered non-responsive and their bids will not be considered. The scope of work being considered includes the removable and installation of traffic signals at the 2 nd Street and Adams Street (OR99W) intersection and at the 2nd Street and Baker Street (OR 99W) intersection. C
2017 signal and intersection improvements
Completed fall 2017
OR 99W AT 2nd ST SIGNAL REPLACEMENT, City of McMinnville Project No. 2015-17

99W both directions at 5th Street crashes 2016-2020
